In GENES, CELLS AND BRAINS, feminist sociologist Hilary Rose and neuroscientist Steven Rose take on the bioscience industry and its claims. Examining the rivalries between public and private sequencers, the establishment of biobanks, and the rise of stem cell research, they ask why the promised cornucopia of health benefits has failed to emerge.

[[Genes, Cells and Brains is] a detailed and acerbic history of 20th-century genetics: its uneasy dance in and out of the arms of eugenics, its stumbles on the envisioned road to decoding and commodifying human nature, and its upstaging after the Human Genome Project disappointed hopes for disease cures by neuroscience, which, in turn, has fallen short of its promises to find and fix the psyche in the brain.]

To understand the diversity of brain cells, researchers have long studied fruit flies, whose brains, although much simpler than those of humans, can be used as a model system. Researchers previously identified the roughly 60,000 cells and 200 neuronal types that make up fruit flies' optic lobes, the areas of the brain that process visual information, including color vision and detection of ...

Genes, Cells and Brains: Bioscience's Promethean Promises ...

Genomics is an interdisciplinary field of biology focusing on the structure, function, evolution, mapping, and editing of genomes. A genome is an organism's complete set of DNA, including all of its genes. In contrast to genetics, which refers to the study of individual genes and their roles in inheritance, genomics aims at the collective characterization and quantification of all of an organism ...

This approach ultimately included 17,338 different genes and 1,239 chemicals in two large groups - pollutants, or pharmaceuticals with known targets. Genes were found to have roughly the same sensitivity to both groups. "That proves that when analysis is done on really big numbers of chemicals, their composition does not matter," Suvorov said.

In their book Genes, Cells, and Brains: The Promethean Promises of the New Biology, Hilary and Steven Rose describe the way science has become the profiteers' playground in the new millennium. Their description of the last few decades of scientific progress in genomics, stem-cell research, and neuroscience is a sobering account of greed, fraud, and political cynicism that will dismay anyone who still thinks science is a disinterested quest for truth.
