Under such conditions, the distance z_2 is equal to the focal length f . The equation becomes $h_2(u) = U_1(u) \exp(-j\pi u^2 z_2 / f)$. For $z_1 = f$ and $z_2 = f$, we have the object illuminated by a normally incident plane wave and situated in the front focal plane. Again $z_2 = f$.

Fourier optics is the study of classical optics using Fourier transforms, in which the waveform being considered is regarded as made up of a combination, or superposition, of plane waves. It has some parallels to the Huygens – Fresnel principle, in which the wavefront is regarded as being made up of a combination of spherical wavefronts whose sum is the wavefront being studied. A key difference is that Fourier optics considers the plane waves to be natural modes of the propagation medium, as ...
